A. Acin - Device-independent quantum information processing

venerdì 20 settembre 2019 16:00 (90)

Device-independent quantum information processing represents a new framework for quantum information applications in which devices are seen as black boxes processing classical information. In particular, no assumptions are made on the inner working of these devices except their quantum functioning. The lecture introduces the main ideas and tools of the device-independent scenario and argues why it is especially relevant for quantum cryptography applications.
