The black box is not that black anymore: The use of eye-tracking in STEM education research

martedì 31 gennaio 2023 09:45 (45)

Despite many attempts to measure pupils and students' learning outcomes, their performance in problem solving has largely remained something of a black box. This talk will therefore focus on the potential of using eye-tracking data in combination with the think-aloud method. Case studies will be used to show how to analyze data from actual science education research. Finally, further possibilities of using eye-tracking in STE(A)M education research will be outlined.
