The Restless Nature of AGN - Napoli 2023

X-ray polarimetry of Seyferts and the nature of the hot corona

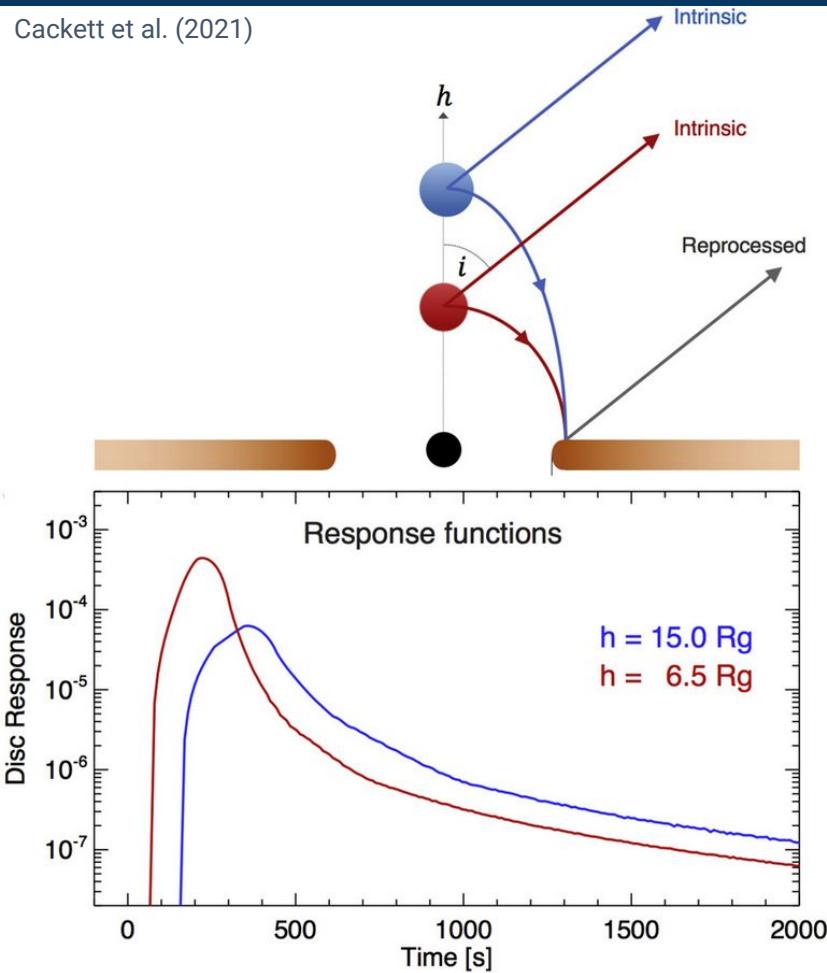

- ★ The Imaging X-ray Polarimetry Explorer (IXPE; Weisskopf+22, Soffitta+21) is the first mission dedicated to X-ray polarimetry and operates in the 2–8 keV band.

X-ray polarimetry of Seyferts and the nature of the hot corona

- ★ The Imaging X-ray Polarimetry Explorer (IXPE; Weisskopf+22, Soffitta+21) is the first mission dedicated to X-ray polarimetry and operates in the 2–8 keV band.
- ★ One of the goals of IXPE is constraining the geometry of the hot corona of unobscured, radio-quiet AGN.

X-ray polarimetry of Seyferts and the nature of the hot corona

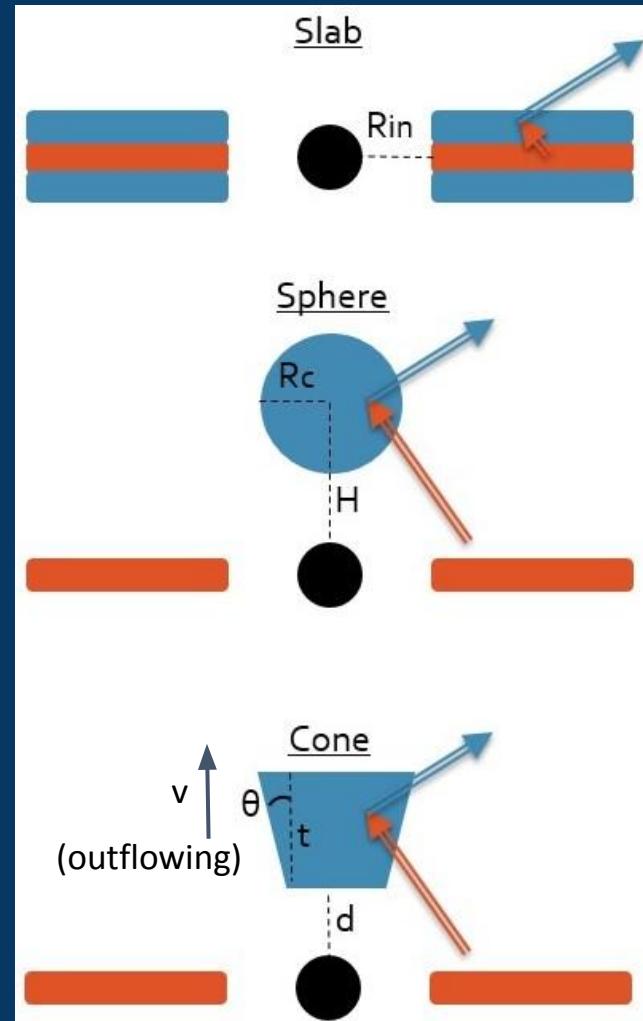

A “lamppost” geometry is often assumed for the hot corona.

Reprocessing of X-rays emitted by the corona in the disc is a standard framework to interpret time lags.
(see e.g. the review talks by McHardy and Mastroserio)

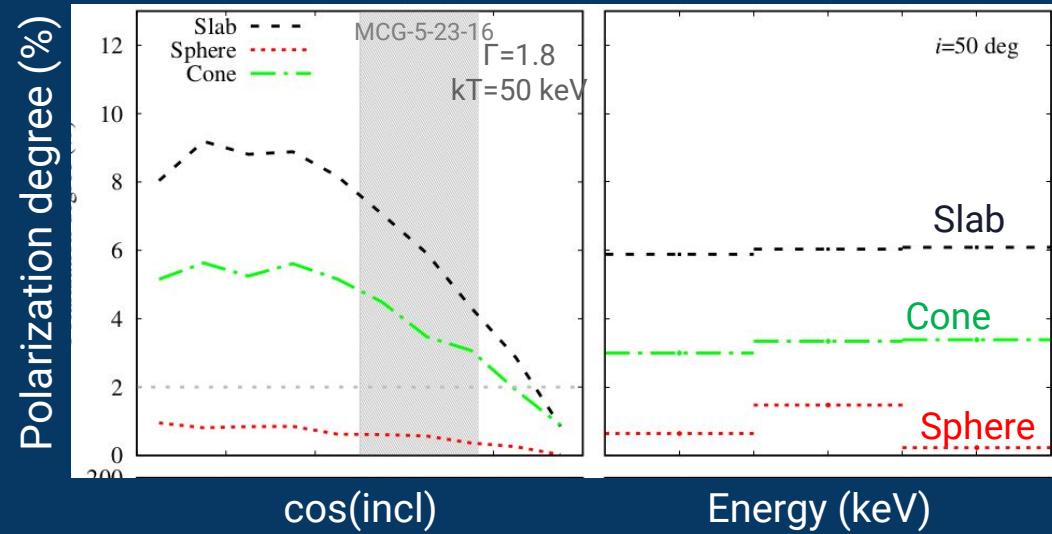

De Gouveia dal Pino et al. (2011)

X-ray polarimetry of Seyferts and the nature of the hot corona

- ★ However, the geometry of the corona is poorly constrained.
- ★ X-ray spectroscopy is not sensitive to geometry, but polarimetry is! The polarization signal measures the deviation from spherical symmetry.
- ★ To simulate the expected X-ray polarization signal, we used the Monte-Carlo radiative transfer code MONK (Zhang et al. 2019), that calculates Comptonized spectra in Kerr spacetime.

IXPE observations

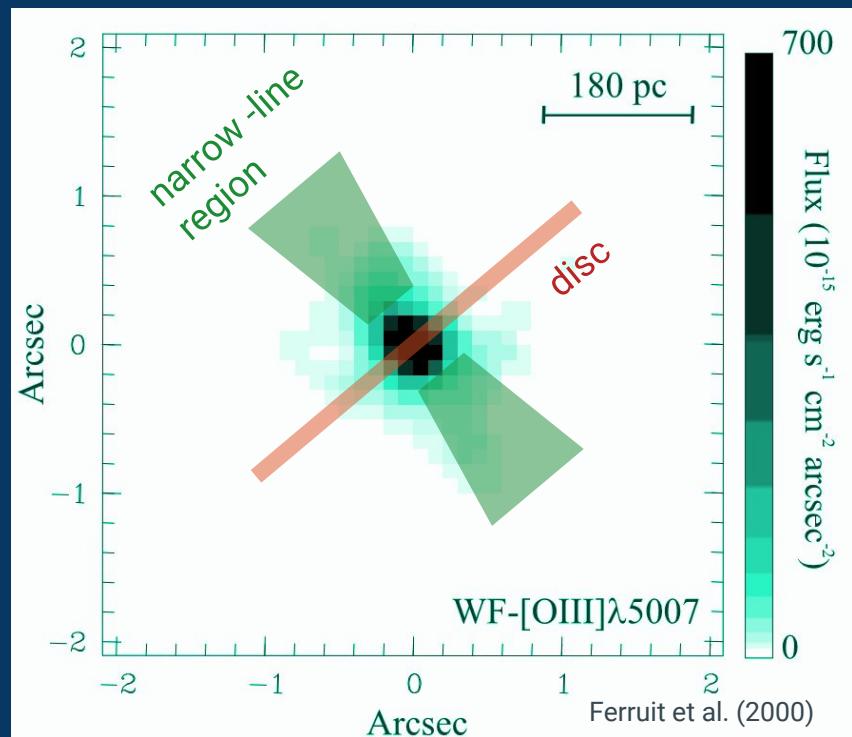

source	Obs date	Exposure (ks)	2–10 keV flux (cgs)
MCG-5-23-16 Marinucci et al. (2022) Tagliacozzo et al. (2023)	May 2022 Nov 2022	1300 (obs 1+2)	7.5e-11
IC 4329A Ingram et al. (2023.)	Jan 2023	470	8e-11
NGC 4151 Gianolli et al. (2023)	Dec 2022	630	1.6e-10

X-ray polarimetry of Seyferts and the nature of the hot corona

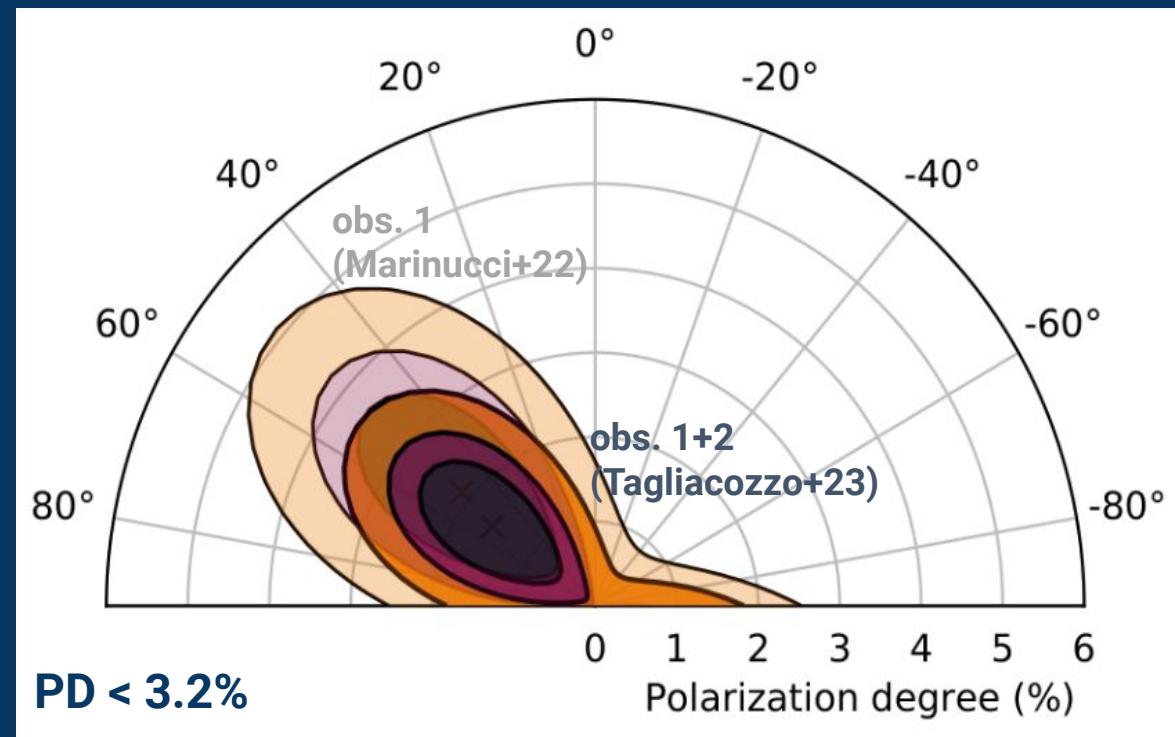

MCG-5-23-16

X-ray polarimetry of Seyferts and the nature of the hot corona

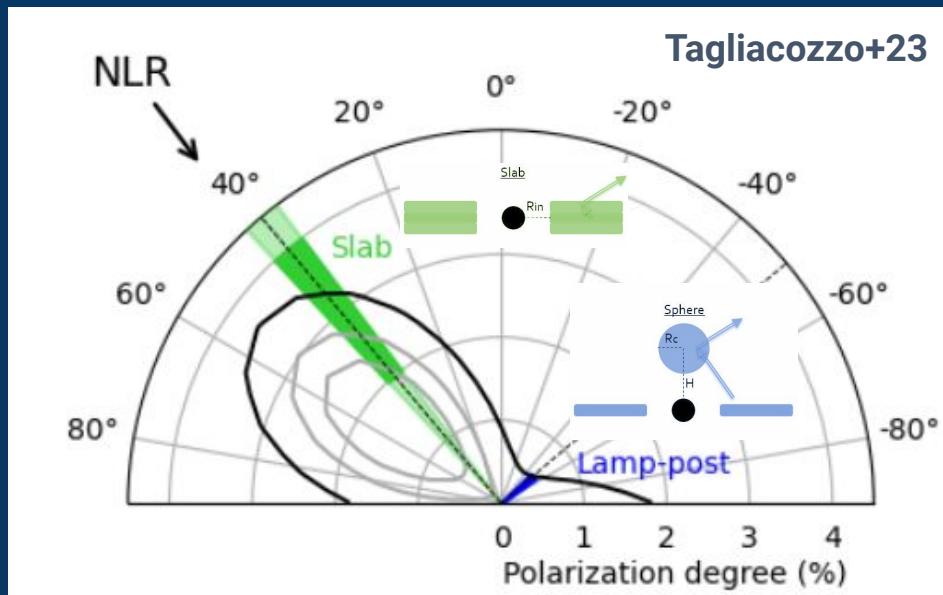

MCG-5-23-16

PA preferentially aligned with the NLR

X-ray polarimetry of Seyferts and the nature of the hot corona

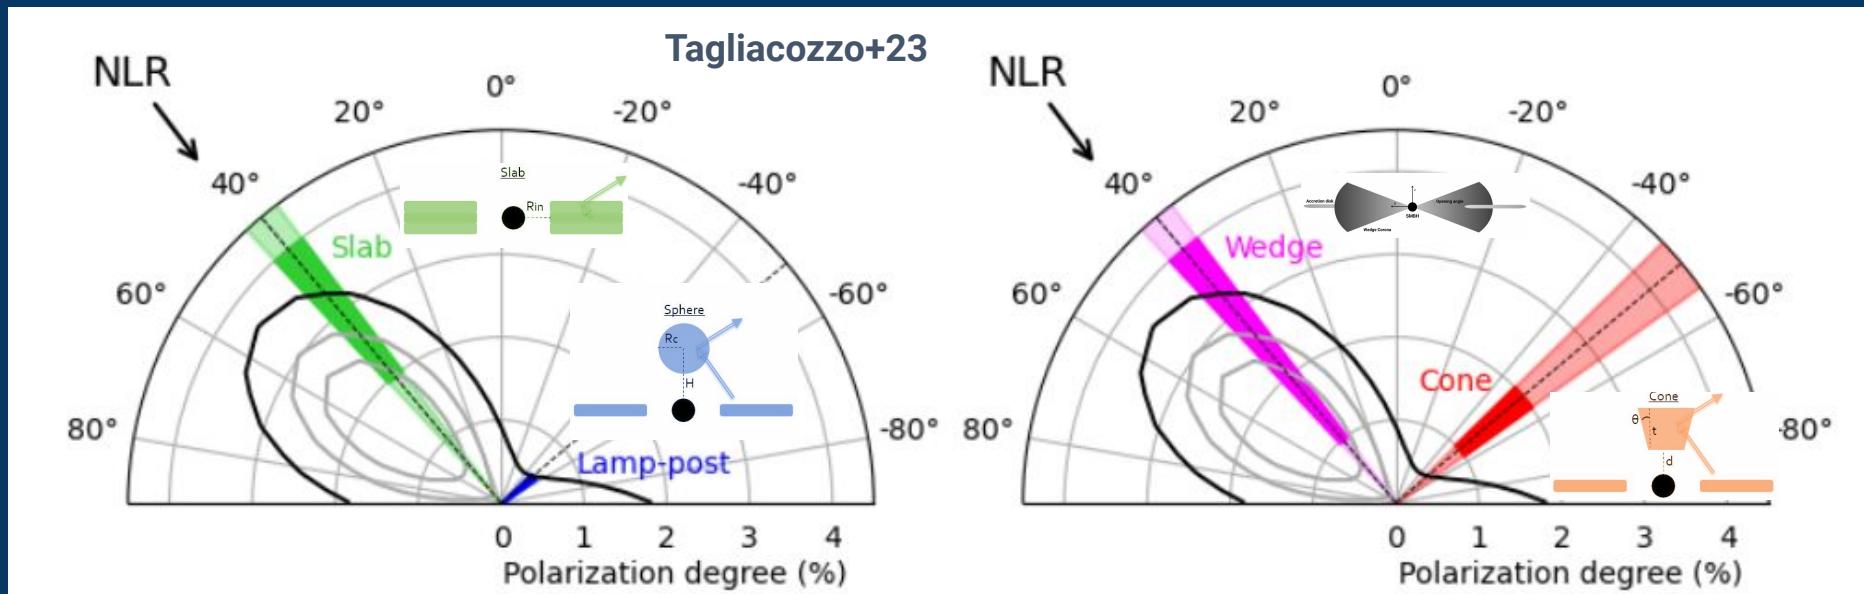

MCG-5-23-16

opaque colors = source inclination of
30–50° (Serafinelli et al. submitted)

X-ray polarimetry of Seyferts and the nature of the hot corona

MCG-5-23-16

opaque colors = source inclination of
30–50° (Serafinelli et al. submitted)

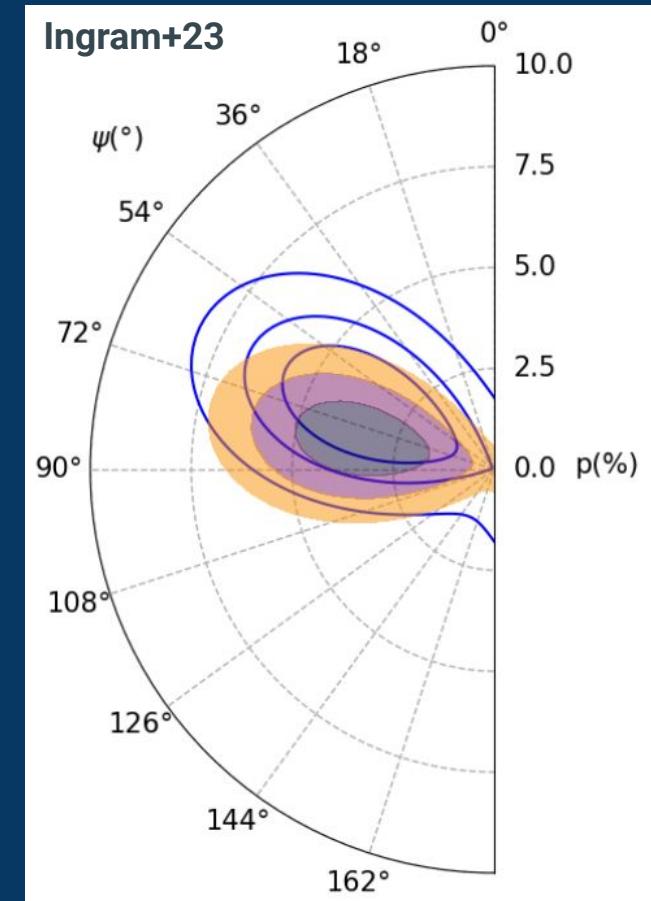

for the **wedge**, see Poutanen, Veledina & Zdziarski (2018)

X-ray polarimetry of Seyferts and the nature of the hot corona

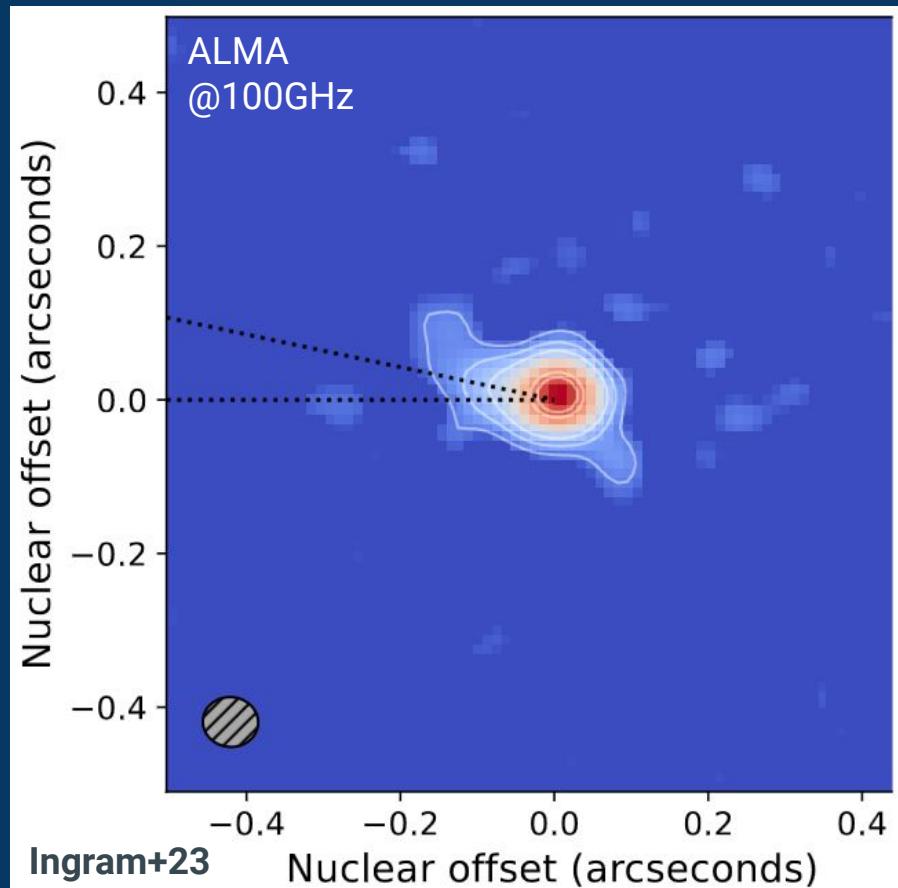

IC 4329A

**PD = (3.3±1.1)%
2.97 σ result**

PD<6.2% at 3 σ

X-ray polarimetry of Seyferts and the nature of the hot corona

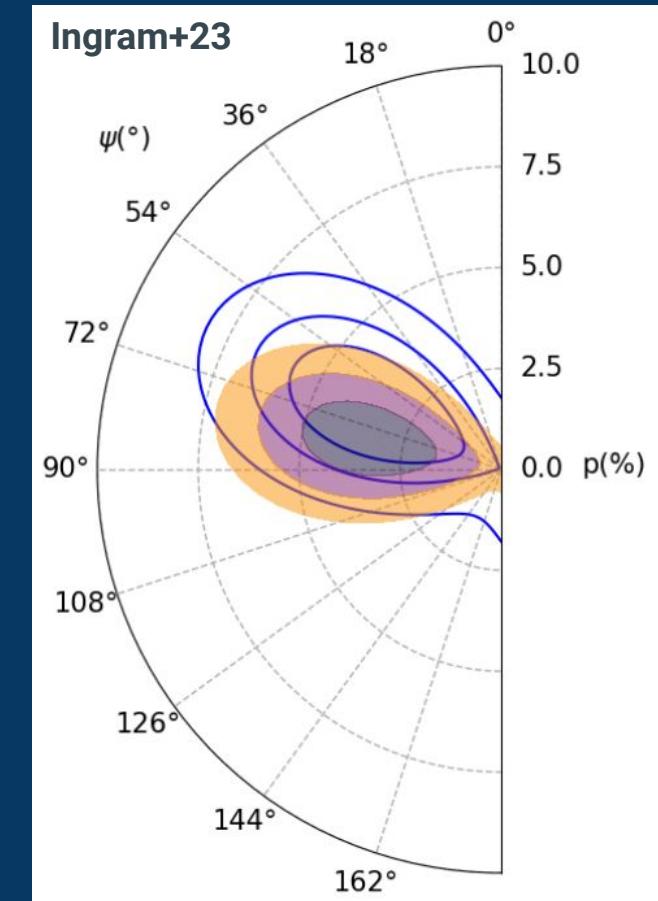

IC 4329A

PD = $(3.3 \pm 1.1)\%$
2.97 σ result

PD < 6.2% at 3 σ

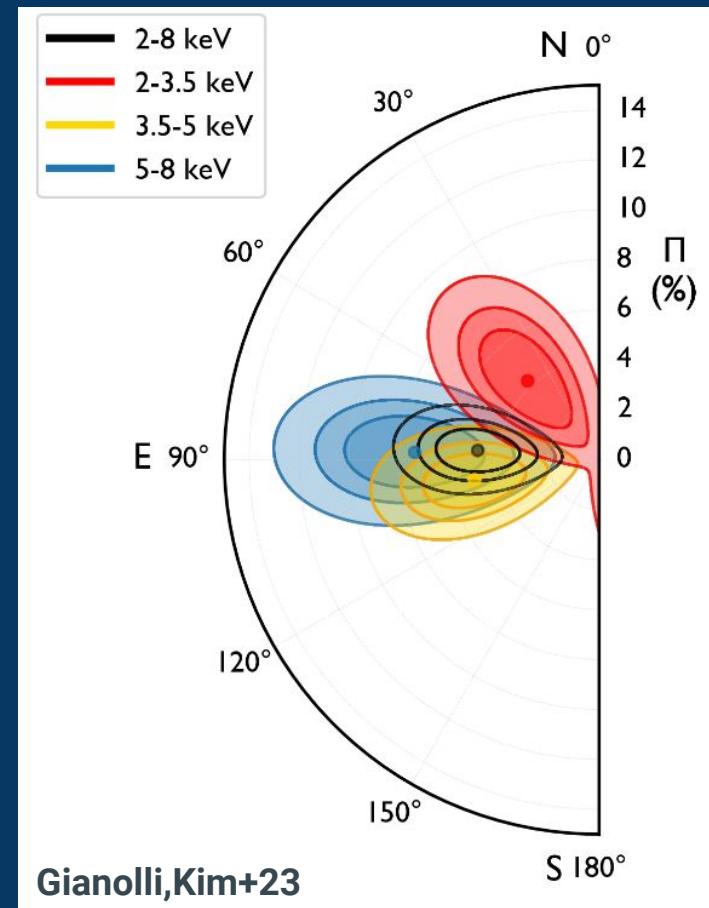

PA preferentially aligned with the radio jet

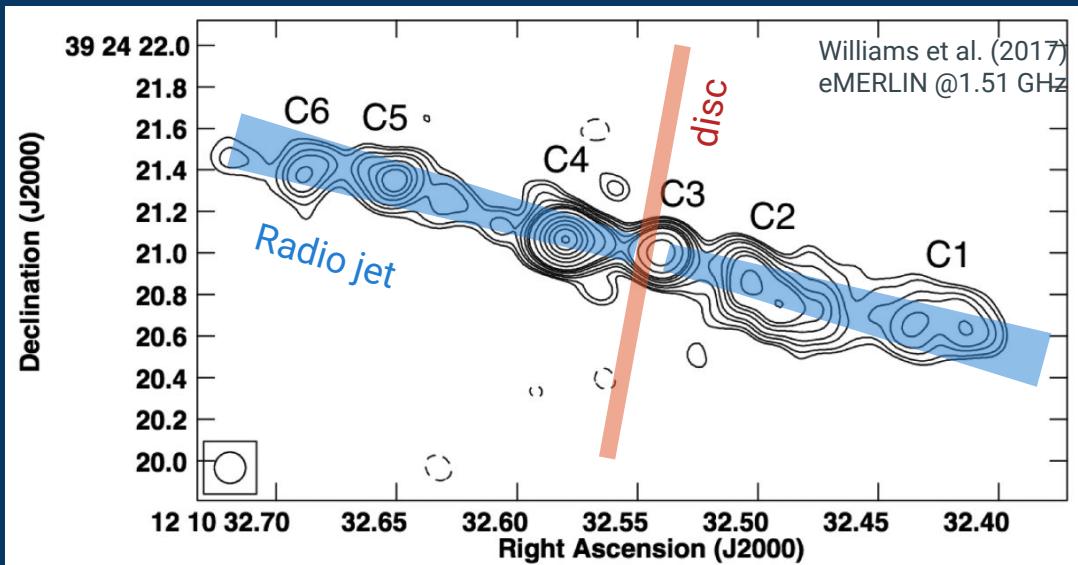

X-ray polarimetry of Seyferts and the nature of the hot corona

NGC 4151

**PD = (4.9±1.1)%
>4σ detection!**

X-ray polarimetry of Seyferts and the nature of the hot corona

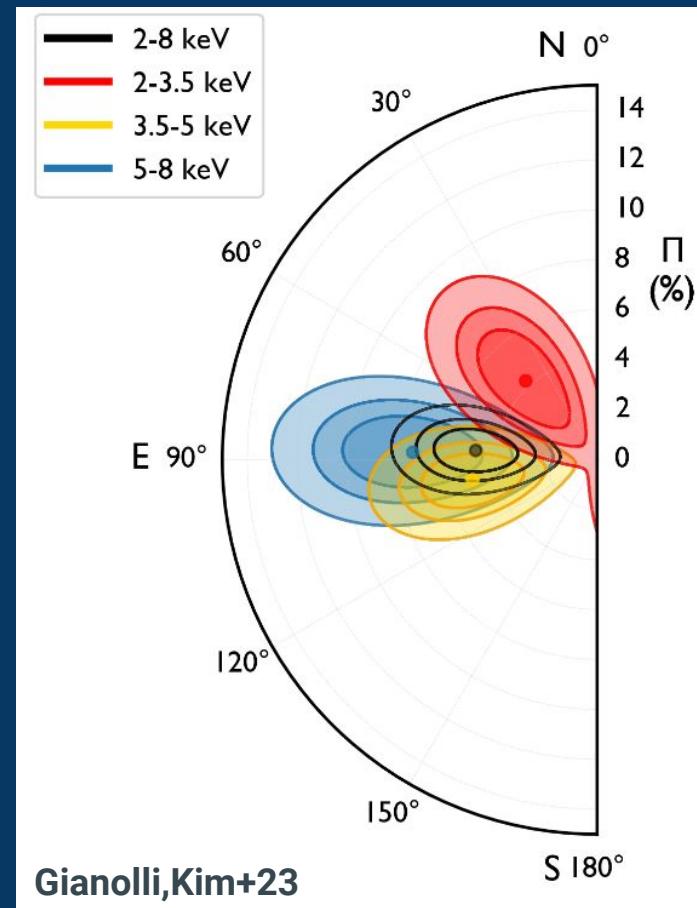

NGC 4151

$$\text{PD} = (4.9 \pm 1.1)\%$$

>4σ detection!

$$\text{PA} = 86^\circ \pm 7^\circ$$

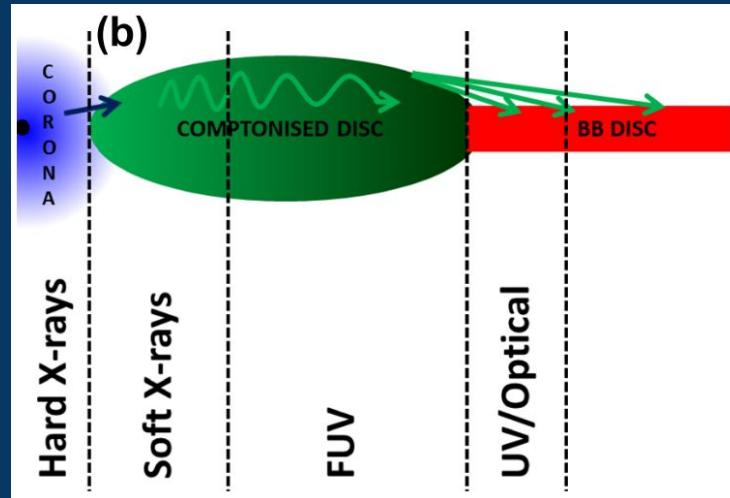

**~consistent with
the radio jet**

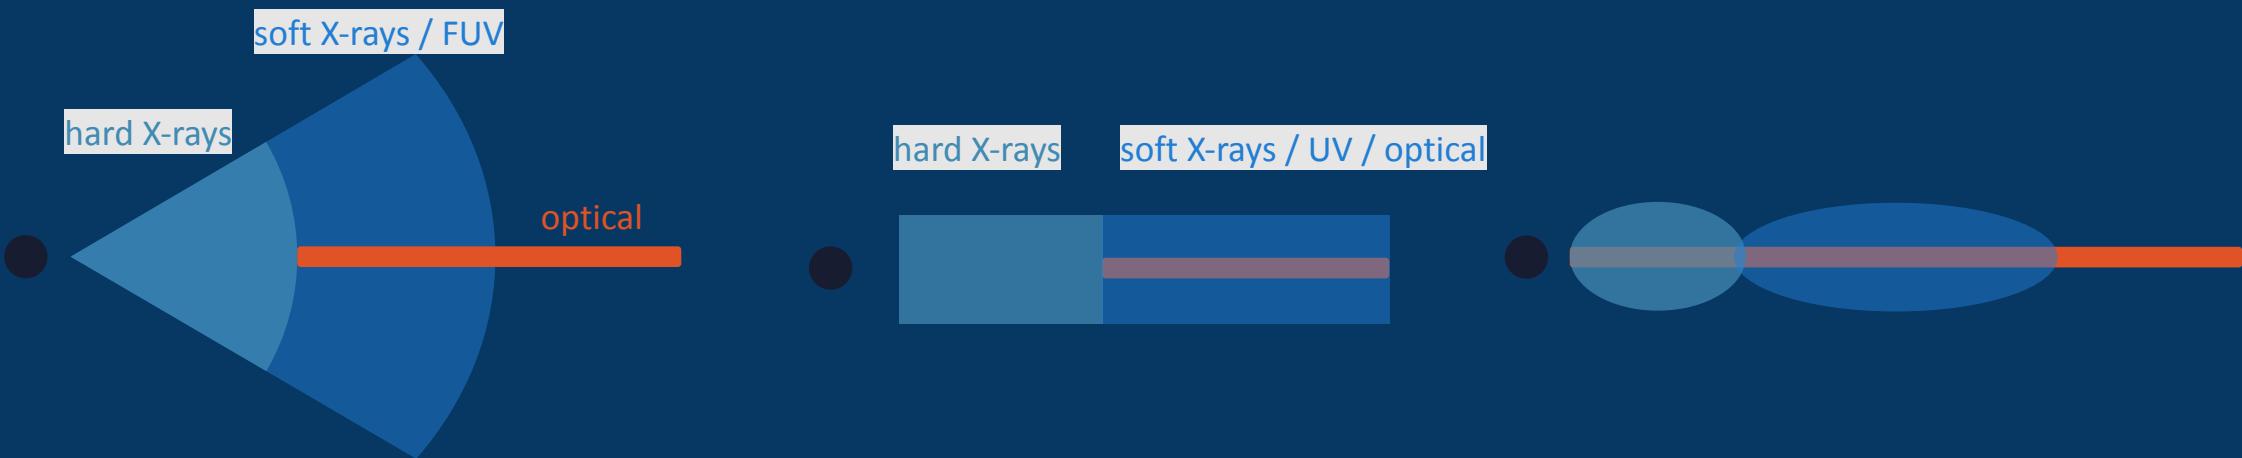

X-ray polarimetry of Seyferts and the nature of the hot corona

- ★ IXPE is providing the first measurements of X-ray polarization in AGN:
 - NGC 4151 → secure detection PD~5%, PA // disc axis
 - MCG-23-16 and IC 4329A → upper limits, anyway favoring PA //
- ★ A spherical corona is ruled out for NGC 4151.
- ★ Any geometry producing high PD and PA \perp disc axis is ruled out for all the three sources.
- ★ These results favor a radially extended corona in the plane of the disc, rather than a vertically extended corona on the disc axis.
