Analyzing the Large-Scale Bulk Flow using CosmicFlows4: Increasing Tension with the Standard Cosmological Model

martedì 30 maggio 2023 10:05 (25)

We present an estimate of the bulk flow in a volume of radii $150\ 200h-1\text{Mpc}$ using the minimum variance (MV) method with data from the CosmicFlows4 (CF4) catalog. The addition of new data in the CF4 has resulted in an increase in the estimate of the bulk flow in a sphere of radius $150h-1\text{Mpc}$ relative to the CosmicFlows3 (CF3). This bulk flow has less than a 0.03% chance of occurring in the Standard Cosmological Model (ΛCDM) with cosmic microwave background derived parameters. Given that the CF4 is deeper than the CF3, we were able to use the CF4 to accurately estimate the bulk flow on scales of $200h-1\text{Mpc}$ (equivalent to 266 Mpc for Hubble constant $H_0 = 75\text{ km/s/Mpc}$) for the first time. This bulk flow is in even greater tension with the Standard Model, having less than 0.003% probability of occurring.
